

A Reflective Journey: Navigating Your Cumulative Experience at Iowa State University

Going through my entire journey at Iowa State again has been a great experience in learning how I learn. Throughout each year I believe that I gained more and more knowledge as to not only the field of EE specifically but rather more specifically the art of problem solving and the craft of learning.

I think the art of problem solving and learning really shines through with the daunting task that can be engineering labs and homework. The difficulty level really struck with classes like EE224 giving being such a huge problem to tackle in terms of the homework that it not only made me better at tackling the 224 problems but gave me a growth oriented mindset. Growth oriented to mean that, I knew I did not know everything I needed to tackle the homework but through going through the gauntlet of them I slowly bridged that gap. And I feel like ever since going through these experiences not only with 224 but EE311 EE514 EE418 230 etc, all of these hammered on that point of learning through the struggle and getting through the mud to finally reach a point where the information not only stuck, but became intuitive and I was able to use it to create things in the lab that I would not be able to before.

I also think that my cumulative experience through the other required classes outside of the major has been a major boon to my overall engineering skills from the aspect of getting to know much more interdisciplinary work and being able to apply that knowledge and work with other people to create much larger projects than would be able to as a solo engineer i.e (Cpre 288 , Senior Design).

Overall I think that my cumulative experience at Iowa State has not only allowed me to create a very deep understanding of EE and in specific Electromagnetism throughout these two core ideas throughout the struggle and pain and suffering that it took to go through these classes. It has been incredibly difficult, but I have loved every minute.
